Maximum cost of a path (1)   P46634_en

Examen parcial d'Algorísmia, FME (2011-10-27)

Given a directed and complete graph with n vertices, and an initial vertex x, compute the maximum cost of all the paths without repeated vertices that begin at x. The given graph is represented by an $n \times n$ matrix M, where for every pair (i, j) with $i \neq j$, m_{ij} is the (perhaps negative) cost of the arc from i to j.

For instance, the maximum cost of the first test is 80, corresponding to the path $1 \to 0 \to 3$, with cost $-10 + 90 = 80$.

Input

Input consists of the number of vertices n, followed by the matrix M (n lines, each one with n integer numbers), followed by the initial vertex x. Vertices are numbered from 0 to $n - 1$. You can assume $1 \leq n \leq 11$, $0 \leq x < n$, that the diagonal has only zeros, and that the rest of numbers are between -10^6 and 10^6.

Output

Print the maximum cost of all the paths without repeated vertices that begin at x.

Sample input 1

```
4
  0 -10   30   90
-10    0   50  -12
-60   35    0   15
 14  -70  -11    0
1
```

Sample output 1

```
80
```

Sample input 2

```
1
0
0
```

Sample output 2

```
0
```

Sample input 3

```
3
  0   6   8
 -4   0   3
 -7  -2   0
2
```

Sample output 3

```
0
```
