Sequence 110 X02122_en

Design a sequential circuit with one binary input and one binary output. The output must be 1 at cycle i when the inputs at cycles $i-2$, $i-1$ and i are 110, otherwise the output must be 0.

The top module must be called *find110*.

```
module find110(in, out, clk, rst);
    input in, clk, rst;
    output out;
```

Hint

The state machine can be implemented with 3 states.

Input

- *clk* is the clock signal

- *rst* is the synchronous reset signal.

- *in* is the binary input.

Output

- *out* is the output that behaves according to the specification.
