## Is regularish

X36643\_en

---

A list containing wordlists, for example:

```
[["a"], ["one", "two", "more"], ["eo", "ai"]]
```

is regularish when all the words in each sublist have the length of this sublist.

Design a function *es\_regulin*(*lpals*) which, given a list of wordlists *lpals*, returns True when *lpals* is regularish.

### Sample session

```
>>> lp = [["a"], ["uno", "dos", "mas"], ["eo", "ai"]]
>>> es_regulin(lp)
True
>>> lpals=[]
>>> es_regulin(lpals)
True
>>> L=[["a"], ["uno", "dos", "tres"], ["eo", "ai"]]
>>> es_regulin(L)
False
```
