
Pair of Consecutive Vowels

X50447_en

Write a function *consec_vow(w)* that receives a word (a string consisting only of lowercase letters) and reports the first pair of consecutive vowels found in it (in the standard left-to-right traversal). The output should be a string of length 2 containing the pair of vowels. In case the string does not have consecutive vowels at all, the function must return the 2-letter string 'NO'.

Observation

Only the function will be evaluated. If your submission includes a main program (e.g. with `testmod`), it must be either commented out or inside a condition `if __name__ == '__main__':`
