## Correct Date

## X54516\_en

---

Write a boolean function `correct_date(d,m,y)` that tells us whether day  $d$  of month  $m$  of year  $y$  represents an actually correct date. Argument  $y$  is always an int between 1800 and 9999. The rules to decide on february 29 for this interval of years can be found in exercise X91228: "Leap Years (2)".

### Sample session

```
>>> correct_date(30, 11, 1971)
True
>>> correct_date(6, 4, 1971)
True
>>> correct_date(4, 8, 2001)
True
>>> correct_date(29, 2, 2001)
False
>>> correct_date(32, 11, 2005)
False
>>> correct_date(30, 11, 2004)
True
>>> correct_date(-20, 15, 2000)
False
```
